

Jansen's Mastoid Retractor

It is also called Jansen's Self-retaining Haemostatic Mastoid Retractor. The instrument has 3 or 4 small hooks in each blade which can be held apart by working the screw at the base of the instrument. It is called as self-retracting because no assistance is required to hold the instrument after application.

Uses:

It is used for retracting the soft tissues after elevating the periosteum in a mastoidectomy, in a thyrotomy, or in a laryngo-fissure. The pressure of retraction can cause the arrest of haemorrhage.
